

Selecting a Degreaser

Multi-Clean has been providing the most effective commercial cleaning products to thousands of customers since 1934.

What is the Best degreaser?

It's the one that gets the job done at the lowest use cost.

When considering a concentrated degreaser, one needs to assess such factors as soil load, soil type, and the method of cleaning. Multi-Clean sister companies include the **Minuteman** and **PowerBoss** brands of automatic scrubbers. This association has given Multi-Clean unique experience in developing high performance degreasers that are specifically designed and safe for use with automatic scrubbers. Putting the wrong degreaser in scrubbers can shorten pump life and overall performance of the machine. These same Multi-Clean degreasers are also highly effective for using with pressure washers, in mop buckets and spray bottles for general degreasing tasks.

To Foam or Not to Foam

Formula 340 is Multi-Clean's strongest degreaser for heavy dirt and oily soils found in manufacturing plants, repair facilities, and other dirty environments. It is low foaming and safe for use in automatic scrubbers. [Formula 340](#)

Tough Green is a neutral, general purpose green certified degreaser. It uses new detergent technology that makes it very effective at removing all types of soils without the caustic characteristics of many degreasers. Tough Green is an all purpose degreaser that can be used at varying dilutions in automatic scrubbers, mop buckets, spray bottles, and pressure washers. [Tough Green](#)

HD Hi-Foam is a high performance, foaming, food service degreaser. Perfect for use in grocery store meat rooms/butcher shops, delis, food processing and kitchens for cleaning food contact surfaces. In these applications, a high foam is preferred for cleaning vertical surfaces. Due to the high foam nature of this product, it is NOT for use with automatic scrubbers. The HD Hi-Foam is formulated differently than other degreasers, because animal fats, and vegetable based oils require different chemistry than petroleum oils found in other types of facilities. [HD Hi-Foam](#)

When comparing degreasers, it is important to understand the cost in use of the degreaser, not the cost of the concentrate. If you are competing against a lower cost degreaser, chances are it is watered down. You need to show that Multi-Clean products are not watered down and can get the job done better at lower dilutions. We have developed a handy spreadsheet calculator that allows you to compare product costs when diluted by answering some simple questions.
